

Important Notes

For Insta360 Capturing and Exporting

Camera Settings:

Keep everything fixed, make sure ISO, Shutter speed, and white balance are all set to manual. Prioritize a faster shutter speed over ISO.

How to position camera when capturing:

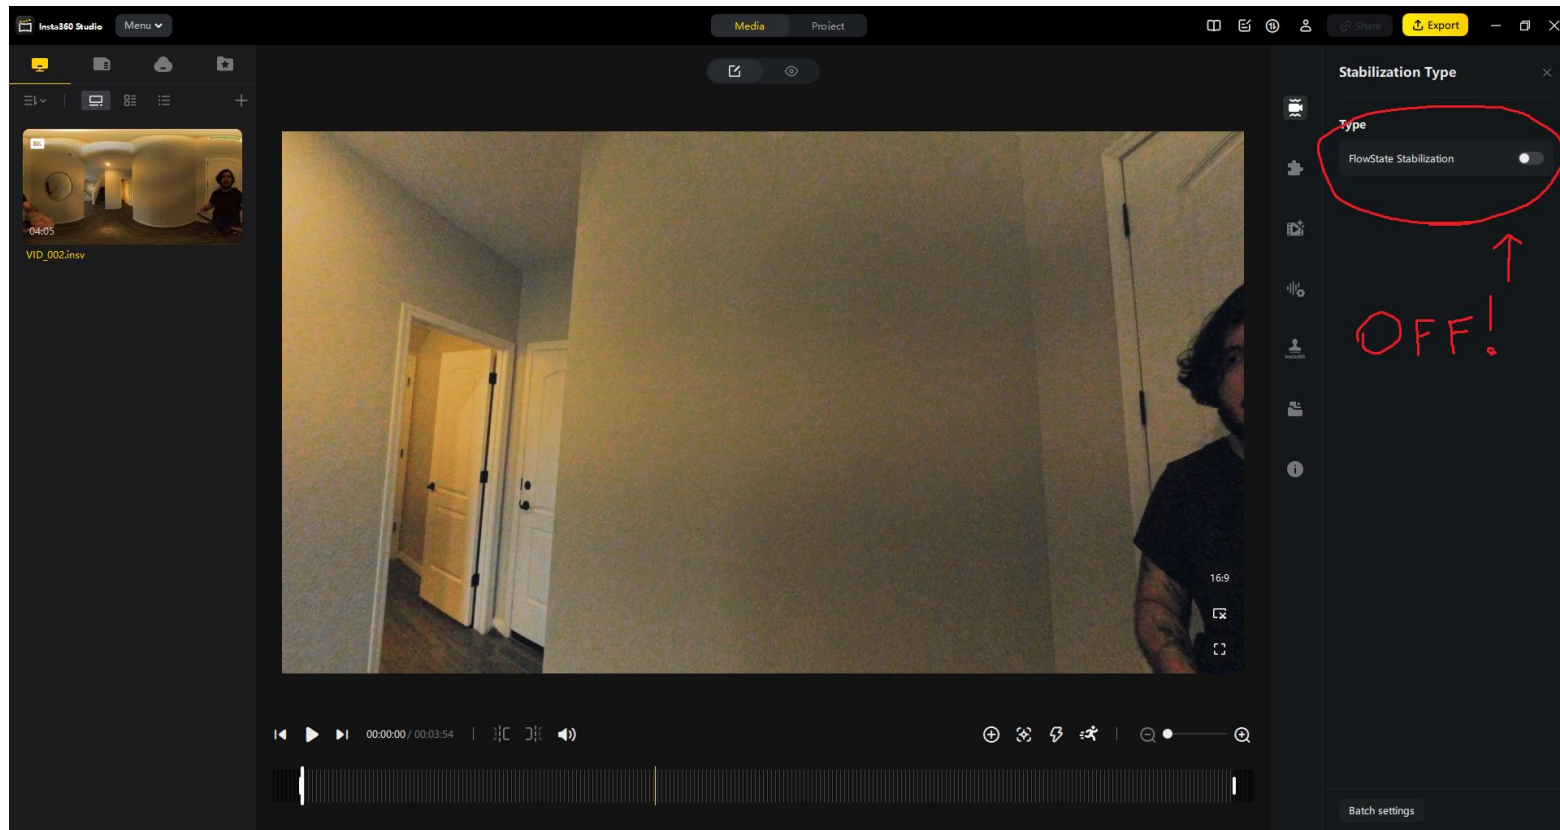

Capture Etiquette:

Use a stick to keep the camera far in front of you to keep yourself from occluding the shots. When capturing in low light conditions, keep your movements steady and avoid fast turns and heavy vibrations. I recommend just one capture at eye level for presentation purposes, but you can use multiple capture levels (high and low) to further enhance the NERF. Just keep in mind the longer the footage the longer it will take to create the output.

You can also use multi camera insta360 rigs, but be sure that they all share the same camera settings. You can drop all of your exported panoramic videos into one folder then drop that folder into the program.

Export Settings: (VERY IMPORTANT!)

Max Quality Settings:
